

Axial Intensity Control of Gauss-Bessel Beams

Exponential phase modulation for axial intensity shaping.

Doc. ID:	FD-BESSEL-AXIAL
Doc. Version:	1.0
Date:	September, 18, 2026
Author	LightTrans International GmbH
SW Package:	VirtualLab Fusion Platform
SW Version:	2026.2 (Build 3.30)

Scenario: Gauss-Bessel Axial Intensity Control

Demonstrated Optical Setup

Component	Specification
Source	Gaussian beam, $\lambda = 1064 \text{ nm}$
Beam Radius	$w_0 = 2 \text{ mm}$
Beam Shaper	Gauss–Bessel Beam Shaper [Modulated Axicon]
Axicon Phase	Equivalent axicon: $\alpha_0 = 1.5^\circ$, $n = 1.45$
Phase Modulation	Gaussian, with adjustable magnitude, width and radial displacement
Detector	1D Field Monitor and Point Evaluation

Description:

- A Gaussian input beam should be transformed into a Gauss–Bessel beam with a uniform axial intensity over an extended propagation region.
- Gaussian type phase modulation provides the parameters for controlling and optimizing this distribution^[1].

Demonstration Goals:

- Show that modulated axicon twin controls the axial intensity distribution of Gauss-Bessel beams.
- Show that optimization method can be used to homogenize the axial intensity.

[1] Quasi-Bessel beam generation by a diffractive axicon with an exponential phase function" Moon et al., Optics & Laser Technology 177, 111059 (2024)

What Twin Is Used in This Demonstration?

Gauss–Bessel Beam Shaper [Modulated Axicon] (*)

- Applies a conical phase to the incident Gaussian beam to generate a Gauss–Bessel beam.
- Adds Gaussian phase modulation to control the axial intensity distribution.
- Provides adjustable modulation magnitude, width, and radial displacement.
- Allows these parameters to be varied and optimized for axial intensity homogenization.
- Optionally exports the designed phase profile for use on an SLM.

Results – Irradiance Along Propagation

Unmodulated

Magnitude: 0

Relative radius: 1.0

Relative center: (0, 0)

Modulated:

Homogenized

Magnitude: 54.8

Relative radius: 1.0

Relative center: (0, 0)

Modulated:

Not homogenized

Magnitude: 70

Relative radius: 1

Relative center: (0, 0)

Results – Irradiance Along Propagation

Unmodulated

Magnitude: 0

Relative radius: 1.0

Relative center: (0, 0)

Irradiance

Modulated:

Homogenized

Magnitude: 54.8

Relative radius: 1.0

Relative center: (0, 0)

Modulated:

Not homogenized

Magnitude: 70

Relative radius: 1

Relative center: (0, 0)

Task – Optimize Modulation Magnitude for Homogenization

Before Optimization

Magnitude: 0

Relative radius: 1.0

Relative center: (0, 0)

Parameter Variation Analyzer:
Evaluates the merit functions in the region

+

Parametric Optimization:
Optimizes the Modulation Magnitude

After Optimization

Magnitude: 54.8

Relative radius: 1.0

Relative center: (0, 0)

Workflow

What the User Does

1. Open the “Optical Setup Gauss-Bessel.os” file.
2. To optimize the modulation magnitude for a homogenized beam, start a new Parametric Optimization.
3. Choose Modulation Magnitude as the parameter.
4. Use the Parameter Variation Analyzer as the detecting device.
5. Set the optimization constraints as in the table.
6. Set to Simplex with 500 iterations.
7. Start optimization

Constraint Name	Use	Weight	Constraint Type	Value 1	Value 2	Start Value
Operator Modulation Magnitude	☒	1	Range	0	100	50
Relative RMS Flatness	☒	1	Target Value	0		N/A
Average Axial Intensity	☒	1	Target Value	Infinity (V/m) ²		N/A

Workflow

What the User Does

- Once the optimization finishes, open the optimized setup.
- Then, use a Parameter run to visualize the Irradiance in (X-Z).
- Observe the homogenized axial irradiance distribution.

For convience, the optimized Gauss-Bessel shaper is provided in “Optimized Optical Setup.os”

The screenshot shows the '180: Parametric Optimization' window. It features a 'Go!' button and a table of optimization results. The table has columns for 'Detector', 'Subdetector', 'Combined Output', and 'Simulation Step' (1-12). The 'Combined Output' column shows data arrays for 'Target Function Value', 'Modulation Magnitude', 'Average Axial Intensity', and 'Relative RMS Flatness'. The 'Simulation Step' columns show numerical values for each step.

Detector	Subdetector	Combined Output	1	2	3	4	5	6	7	8	9	10	11	12
Optimizer Logging	Target Function Value	Data Array	0.00128	4.82e-05	0.000549	0.000214	0.000283	9.87e-05	9.53e-05	5.71e-05	6.47e-05	4.93e-05	5.37e-05	4.79e-05
Parameter Constraints	Modulation Magnitude	Data Array	50	55	60	57.5	52.5	56.2	53.8	54.4	55.6	54.7	55.3	54.8
Parameter Variation Anal...	Average Axial Intensity	Data Array	154 (V/m) ²	150 (V/m) ²	142 (V/m) ²	146 (V/m) ²	152 (V/m) ²	148 (V/m) ²	151 (V/m) ²	150 (V/m) ²	149 (V/m) ²	150 (V/m) ²	149 (V/m) ²	150 (V/m) ²
Parameter Variation Anal...	Relative RMS Flatness	Data Array	0.0352	0.00188	0.0224	0.0129	0.0155	0.00728	0.00717	0.00358	0.00441	0.00218	0.00295	0.00182

The screenshot shows the '188: Parameter Run' window. It features a 'Parameter Specification' section with a 'Usage Mode' dropdown set to 'Standard'. Below this is a table with columns for 'Parameter', 'Vary', 'From', 'To', 'Steps', 'Step Size', and 'Original Value'. The table lists parameters like 'Field Monitor [1D]' and 'Basal Positioning (Relative)'. The 'Distance Befo...' parameter is checked for variation.

1	2	Parameter	Vary	From	To	Steps	Step Size	Original Value
		Field Monitor [1D] (# 600)						
		Basal Positioning (Relative)						
		Distance Befo...	☒	0 mm	300 mm	101	3 mm	100 mm
