Graphics Add-ons

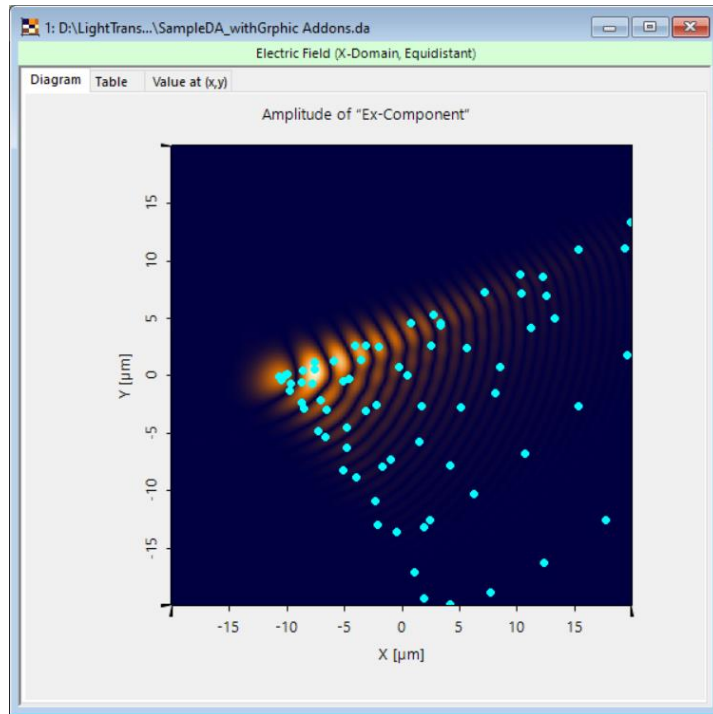

While the fast and accurate provision of simulation results is the main purpose of any optical simulation software, the ability to customize the visualization of the results should not be underestimated. Therefore, VirtualLab Fusion provides the user with a set of tools to help adding meaningful information to the raw numerical data. In this use case we want to put the spotlight on the Graphics Add-Ons, allowing the user to overlay a field result with various forms of additional information, such as point clouds, specific regions or visualizations of polarization ellipses.

Graphics Add-Ons

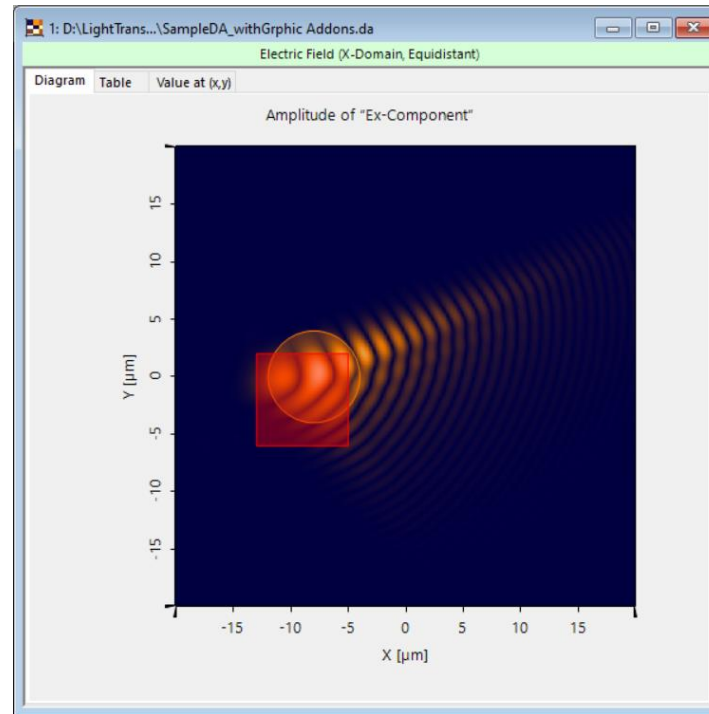

The *Graphics Add-Ons* allow the user to overlay a field result with additional information in graphic form, such as point clouds, specific regions or visualizations of polarization ellipses.

How to Add a Data Overlay to Another Data Array

The screenshot displays the WYROWSKI VirtualLab Fusion 2023.1 (Build 1.556) interface. The 'Manipulations' tab is active, showing the 'Add Point Cloud' tool. Three red circles with numbers 1, 2, and 3 indicate the steps: 1. Selecting the 'Add Point Cloud' tool. 2. Clicking the 'Add Point Cloud' button. 3. Selecting the target data array ('3: "Universal Detector" (# 600) (Profile: Ray Results)') in the 'Select Point Cloud Data' dialog box. The main workspace shows two data arrays: '4: "Universal Detector" (# 600) (Profile: General)' displaying an electric field amplitude plot, and '3: "Universal Detector" (# 600) (Profile: Ray Results)' displaying a point cloud plot. The 'Property Browser' on the right shows the settings for the selected data array.

To add additional information (e.g. a point cloud) to another *Data Array*, first select the *Data Array* in question. Then, under the *Manipulations* tab, the tool *Add Point Cloud* should be visible. After clicking there, a list of all open point cloud results available to act as the overlay will pop up, for the user to choose the desired one.

Configure Graphics Add-ons

Name	Subsets	Visible	Edit
Array of Polarization Ellipses in xy-Plane	#1: Ex-Component #2: Ey-Component	<input checked="" type="checkbox"/>	
Point Cloud from Ray Distribution	#1: Ex-Component #2: Ey-Component	<input checked="" type="checkbox"/>	
Elliptic Region	#1: Ex-Component	<input checked="" type="checkbox"/>	
Rectangular Region	#1: Ex-Component #2: Ey-Component	<input checked="" type="checkbox"/>	

OK Cancel Help

In this example we can see that the elliptical region is only available for the x component while the rectangular region is defined for both x and y components.

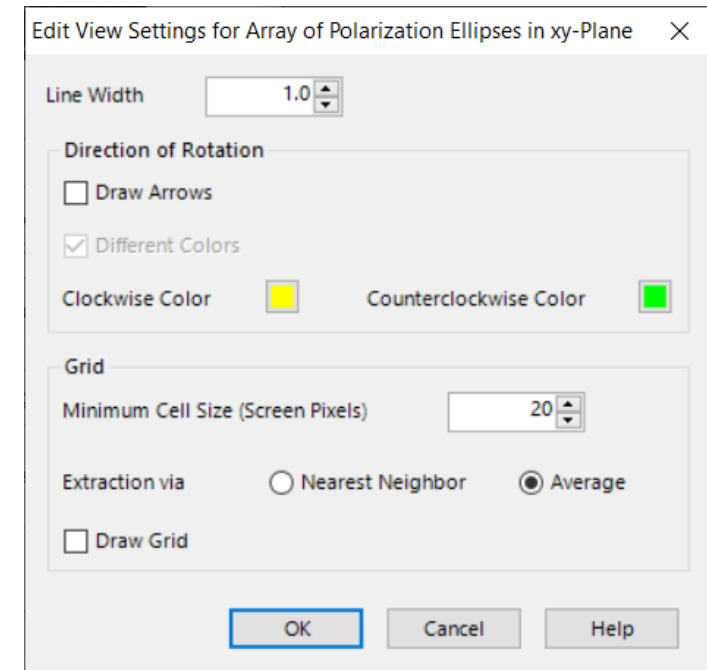

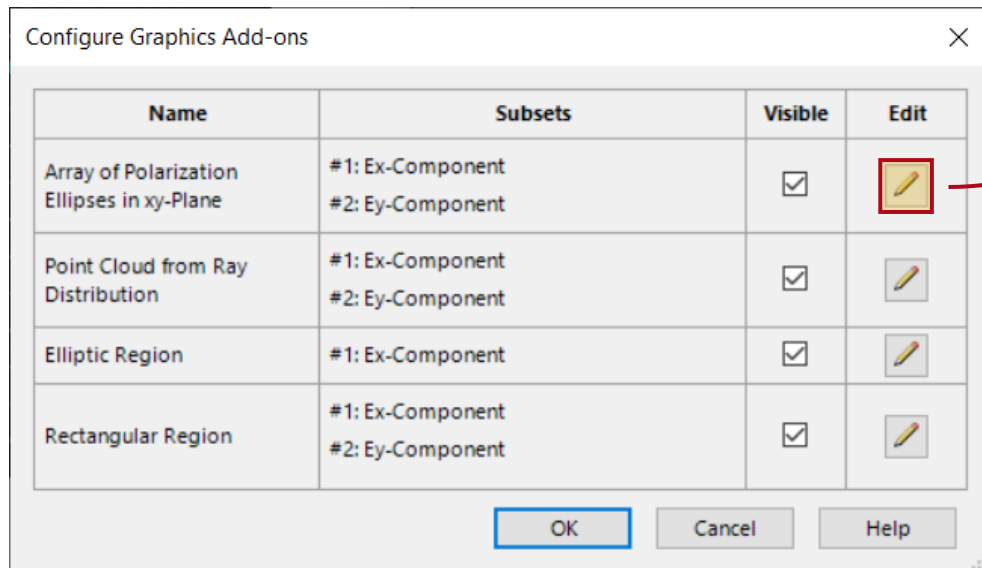

With the *Configure All* button, the user can get an overview of all graphics add-ons assigned to a data array. For different components, the graphics add-on can be different.

Visualization Options – Polarization Ellipses

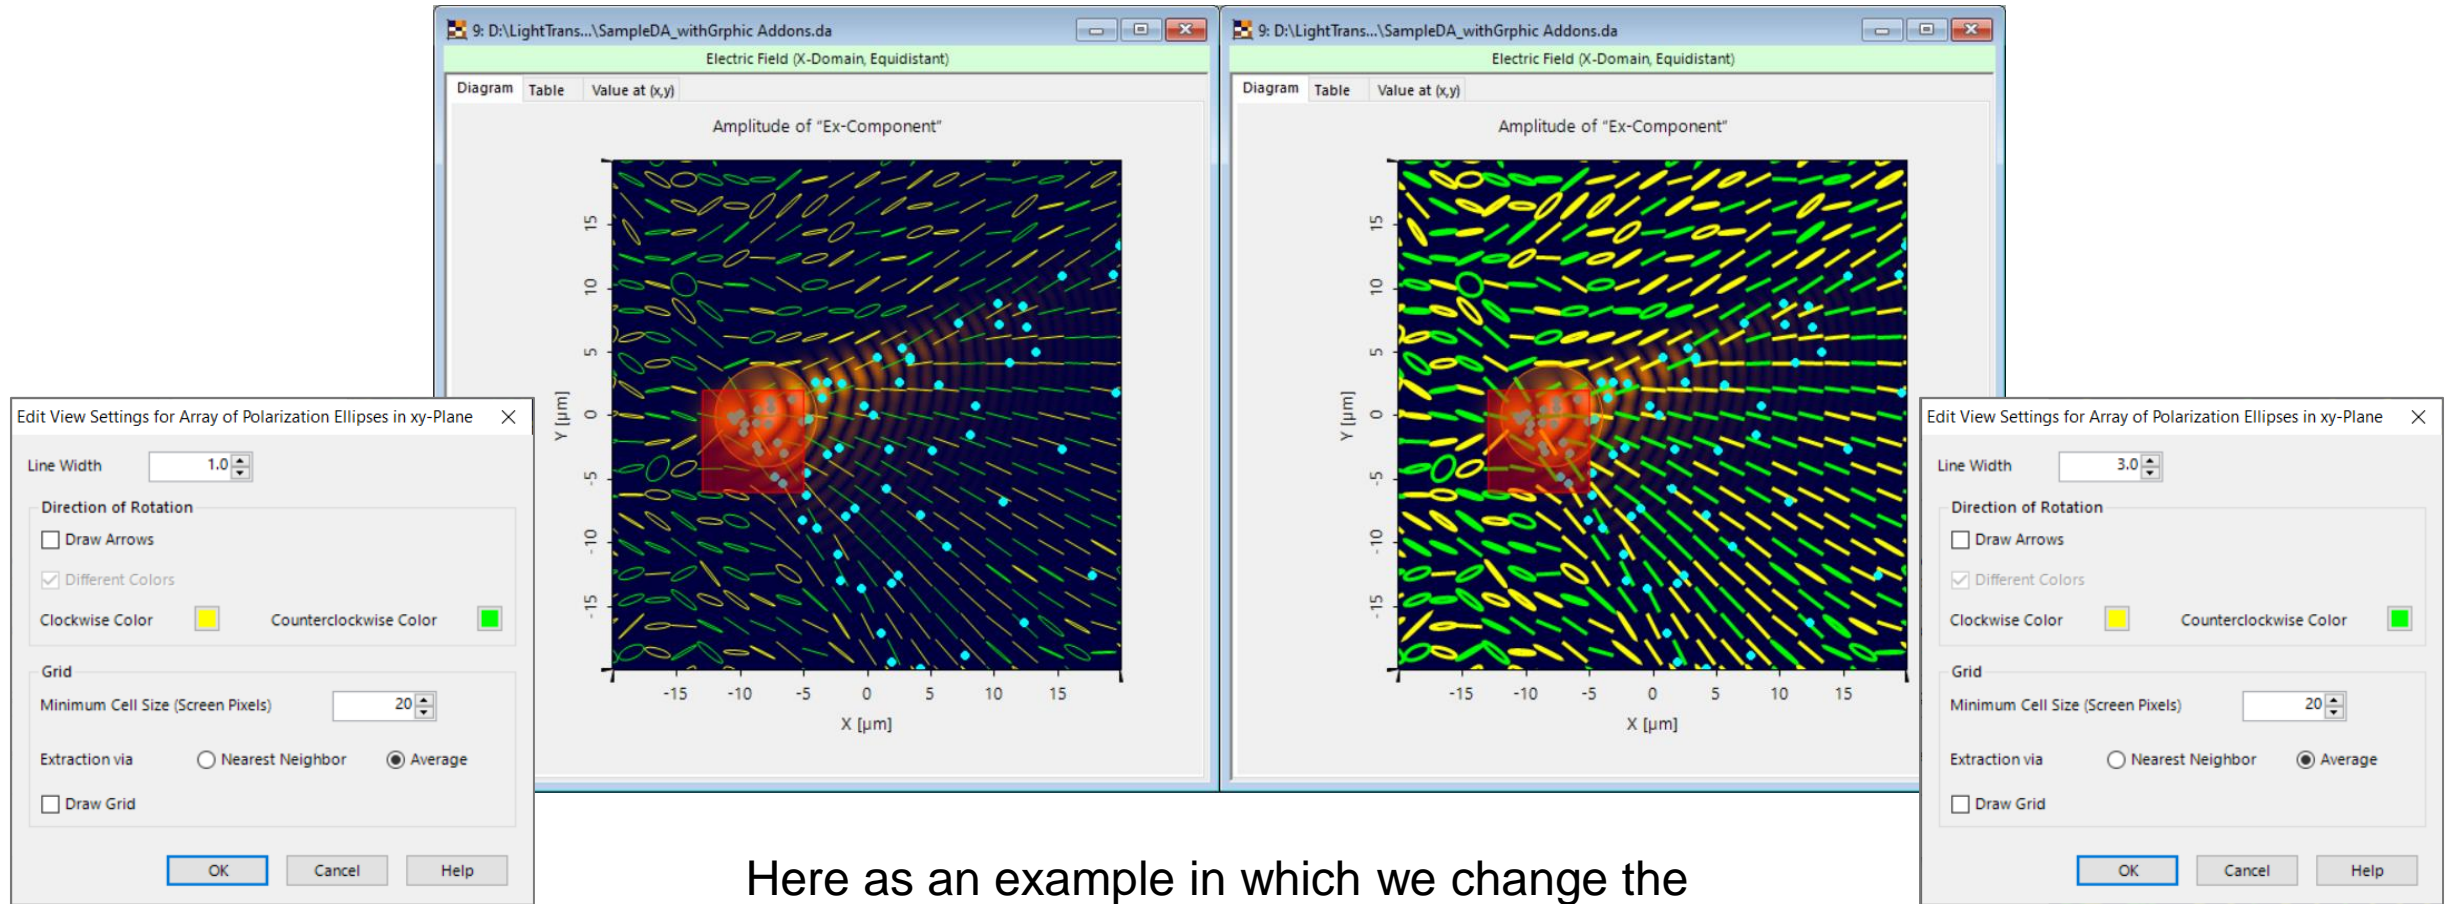

The visualization options for the Polarization Ellipses can also be accessed directly from the main menu. This is a shortcut, the options itself are identical.

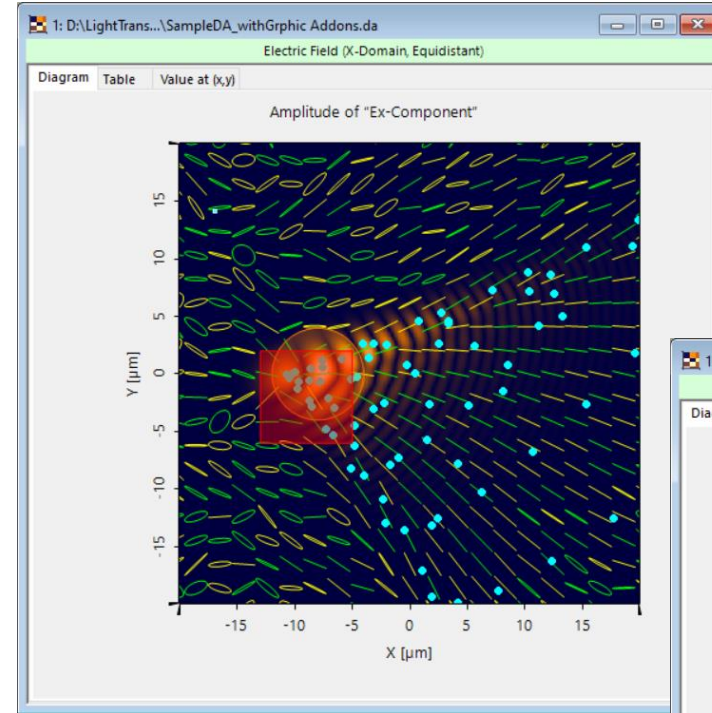

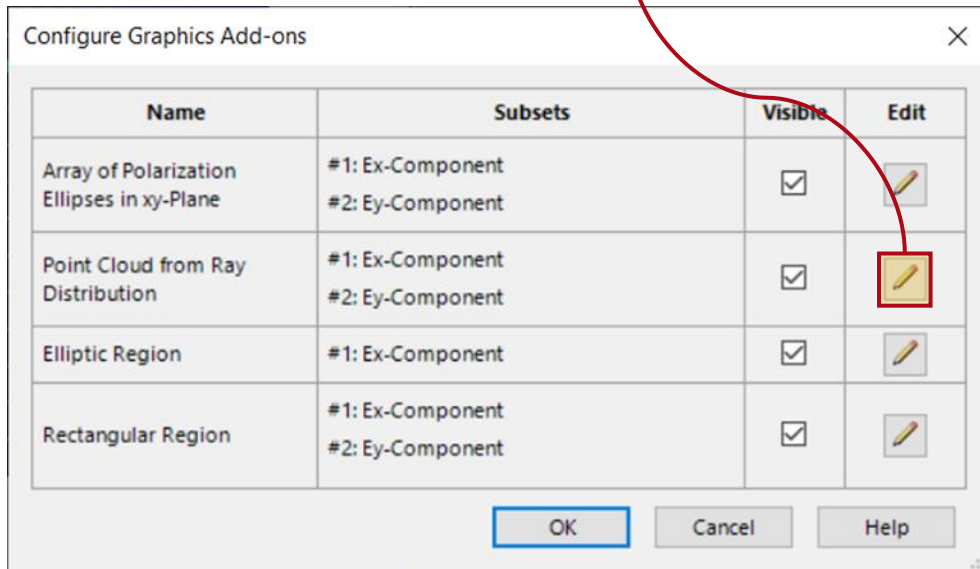

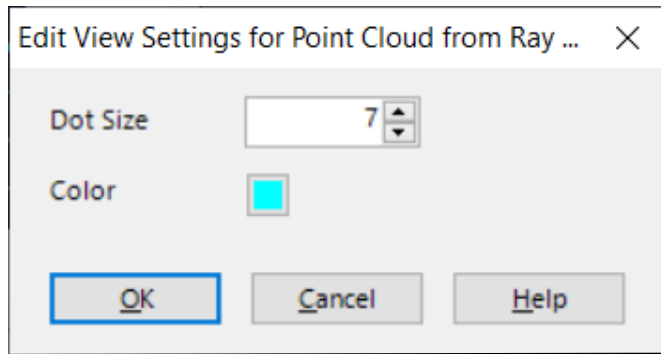

With the *Configure All* button, the user can get an overview of all graphic add-ons assigned to a data array. The view settings of each add-on can be adjusted by clicking on *Edit*.

The thickness and color of *Polarization Ellipses* can be changed. There are also a few more options, like the addition of arrows or the visualization of the underlying grid.

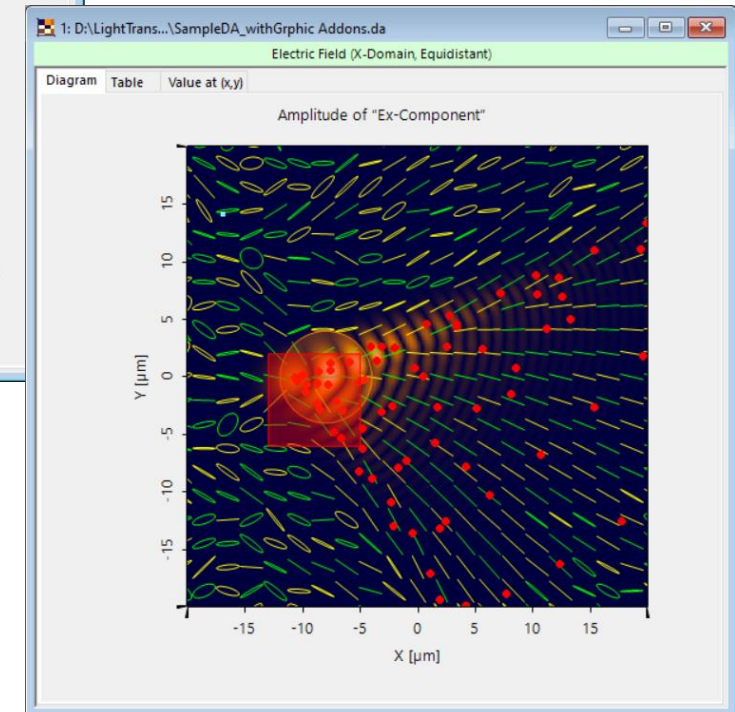

Example for Polarization Ellipse Visualization

Visualization Options – Point Clouds

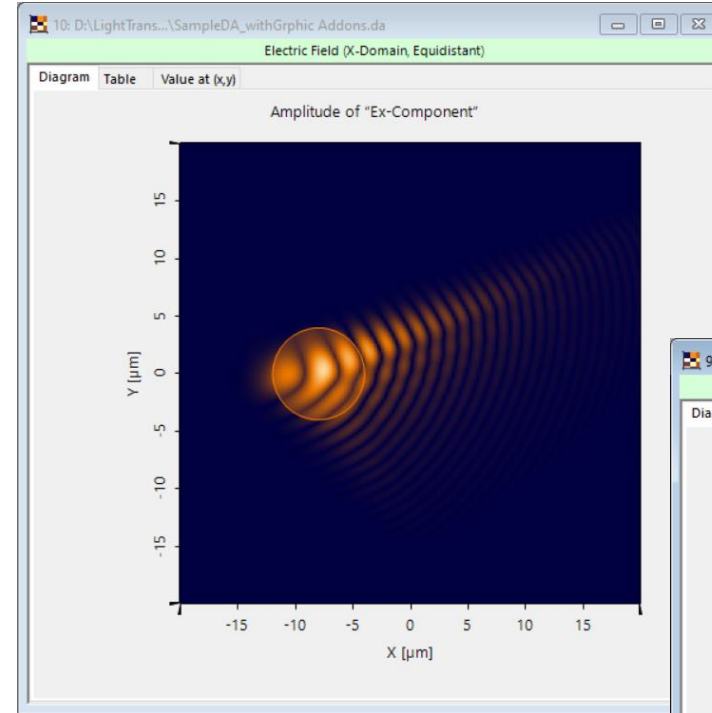

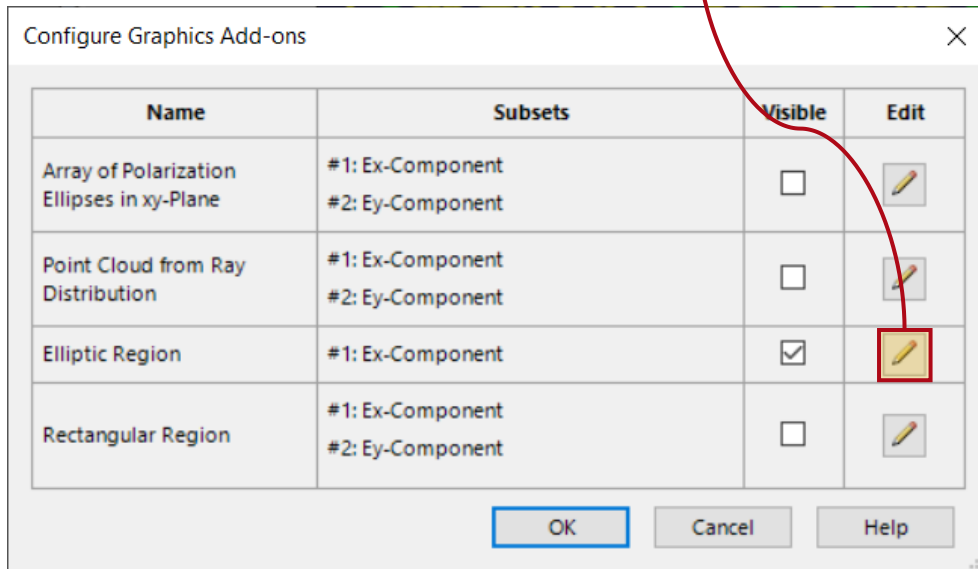

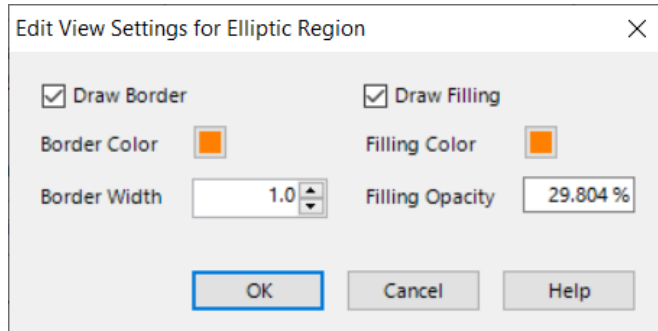

Here we change the color of the point cloud from cyan to red.

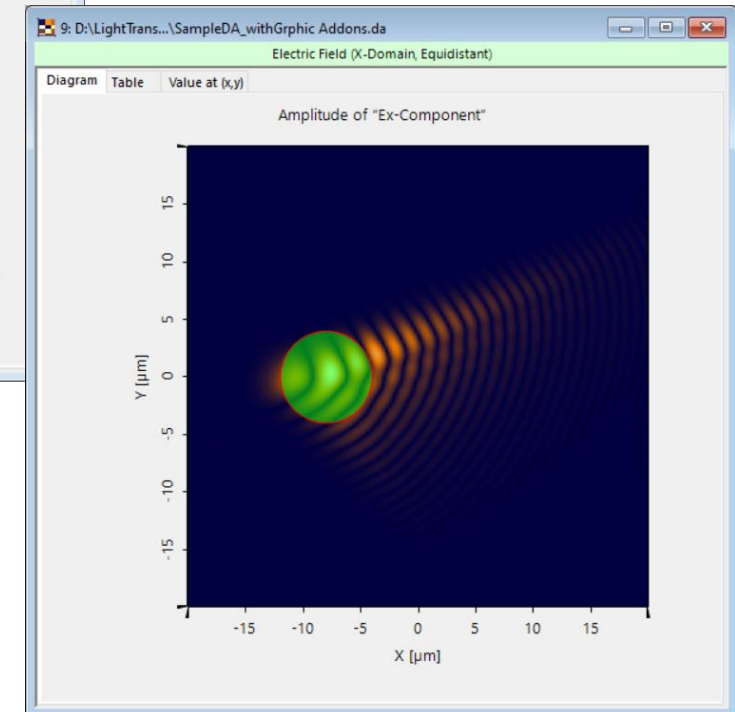

For point clouds, size and color of the points can be customized.

Visualization Options – Regions

Here we change the color of the elliptic region from orange to green. The opacity is changed from 30% to 50%.

For *Regions*, it is also possible to fill it with a different color. The user can uncheck the *Visible* option for other graphics add-ons to emphasize a specific one.

Document Information

title	Graphics Add-ons
document code	SWF.0032
document version	1.0
software edition	VirtualLab Fusion Basic
software version	2023.1 (Build 1.556)
