

Optimal Working Distance for Coupling Light into Single-Mode Fibers

Abstract

In this example, we select a commercially available lens and show how to find the optimal working distance to achieve maximum coupling efficiency. Starting from a geometrically found focus position, the optimal distance is evaluated using diffractive propagation methods.

Application Scenario

Application Scenario: System

Input field

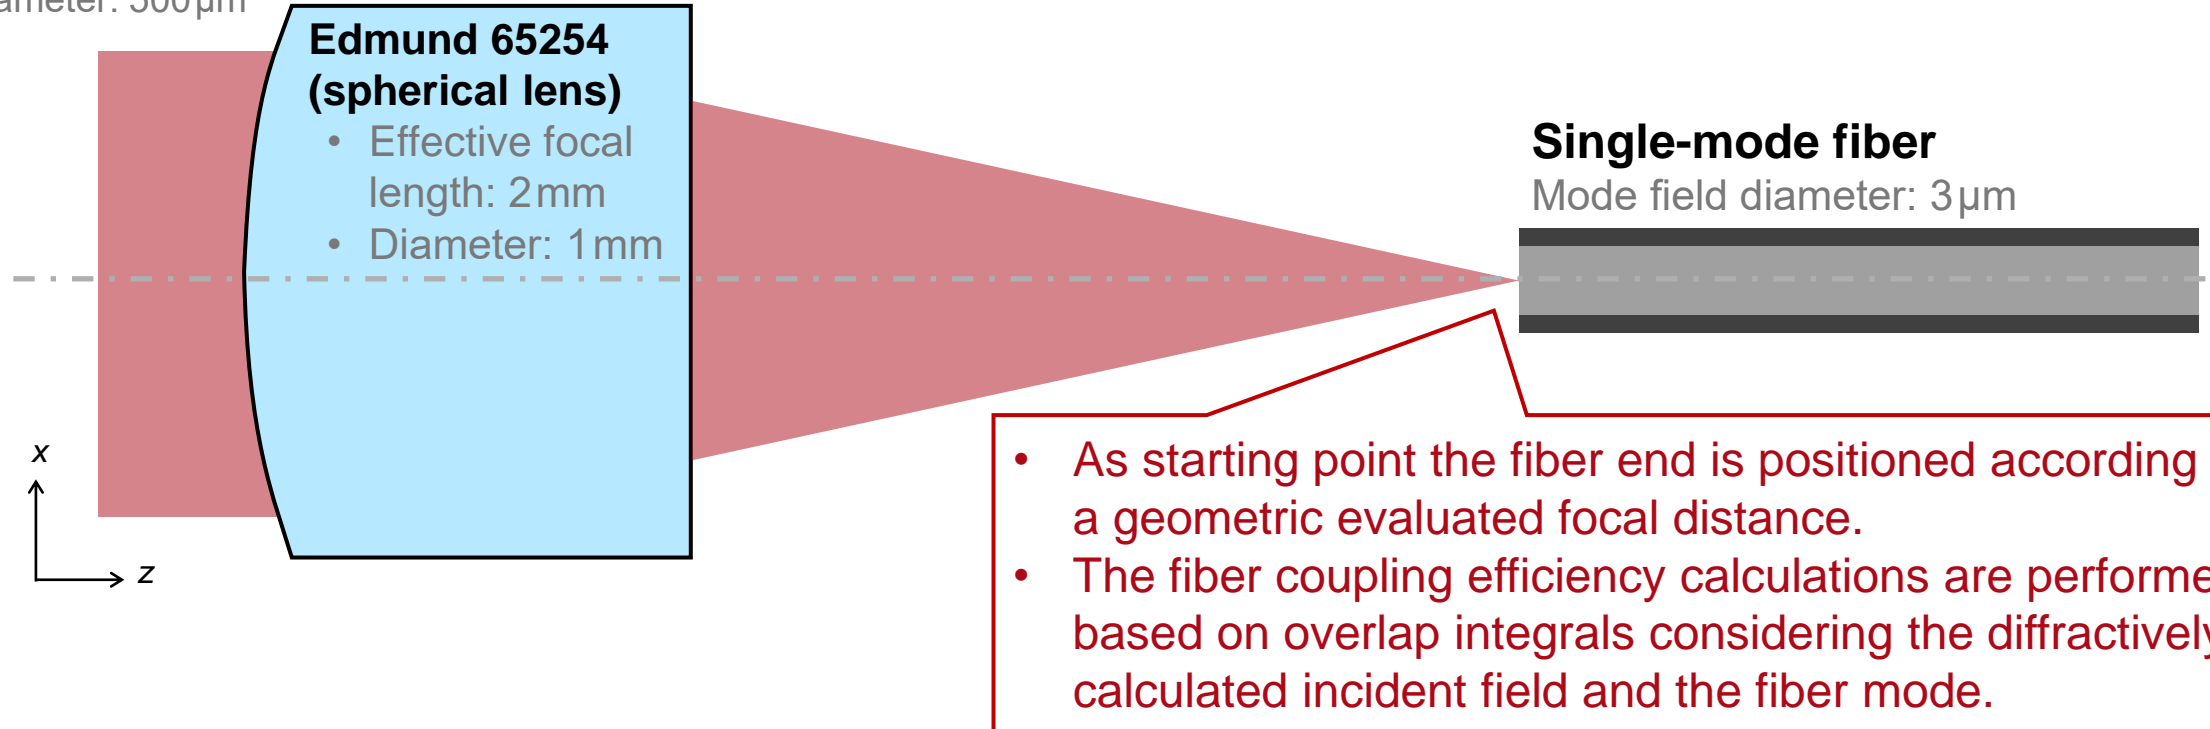

- Fundamental Gaussian
- Wavelength: 780nm
- Diameter: 500 μm

Application Scenario: System

Input field

- Fundamental Gaussian
- Wavelength: 780nm
- Diameter: 500 μm

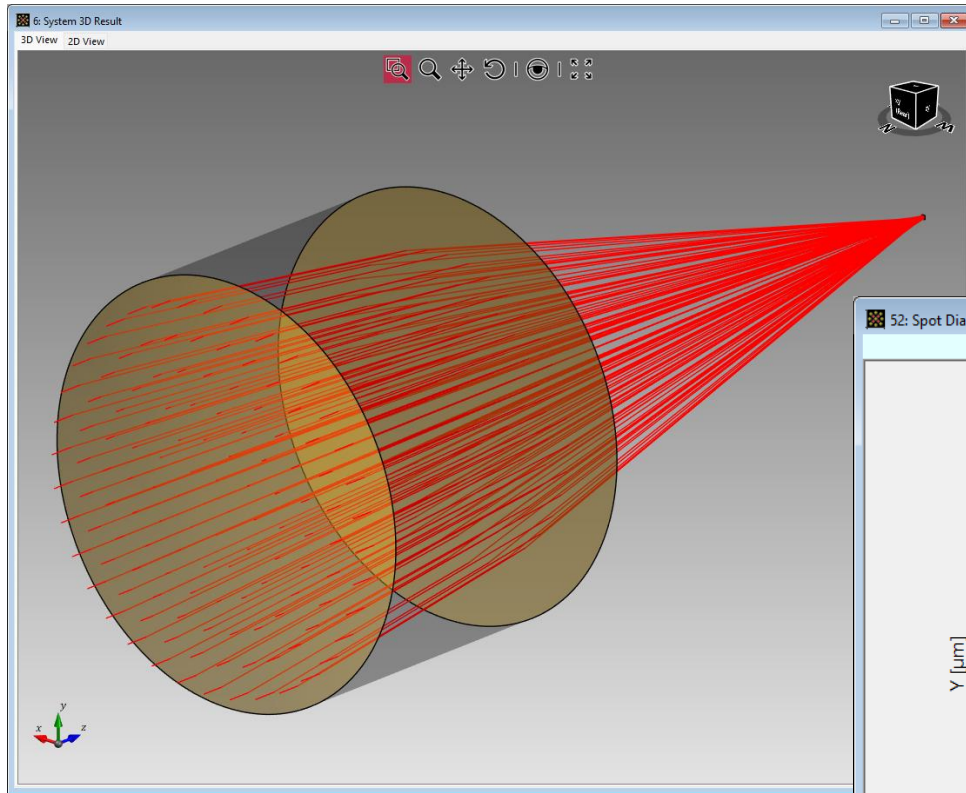

Application Scenario: Task

Find the optimal working distance d to maximize fiber coupling efficiency.

Initial Working Distance by Focal Spot Calculation

Field Evaluation at Ray-Optics' Focal Distance

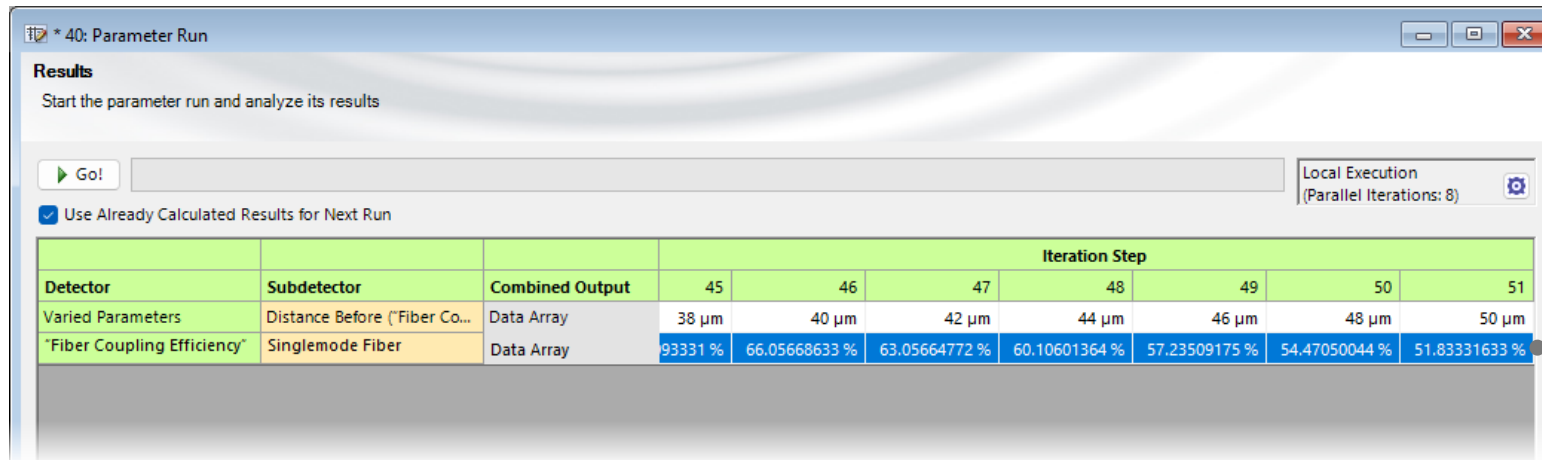

Amplitude (x-component)

1D Cut

VirtualLab Fusion provides access to the full field information at any desired plane in the system.

Optimal Working Distance by Parameter Run

The optimal working distance found by evaluating the field is 1.588 mm.

Field Evaluation at Ray-Optics Focal Distance

Amplitude (x-component)

1D Cut

The focal spot with highest coupling efficiency has similar shape to the fiber mode.

Workflow Steps

Basic Workflow Steps

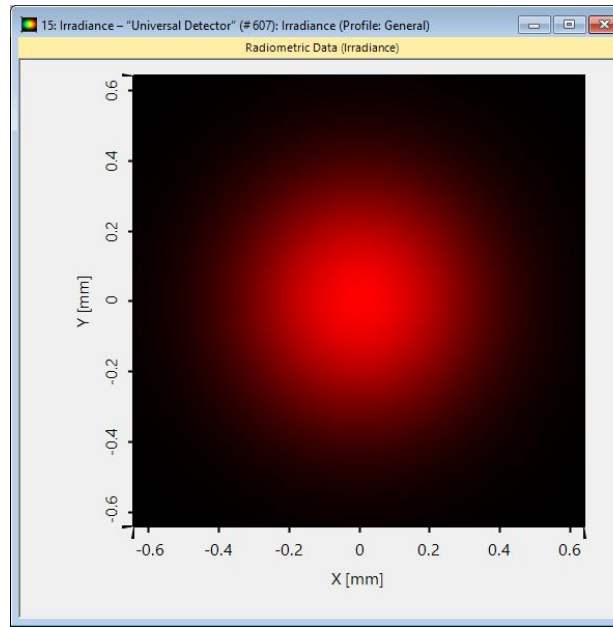

Source selection

System setup

Detector selection

Getting it done in VirtualLab Fusion:

➤ Gaussian Wave

Irradiance of source

Source settings

Basic Workflow Steps

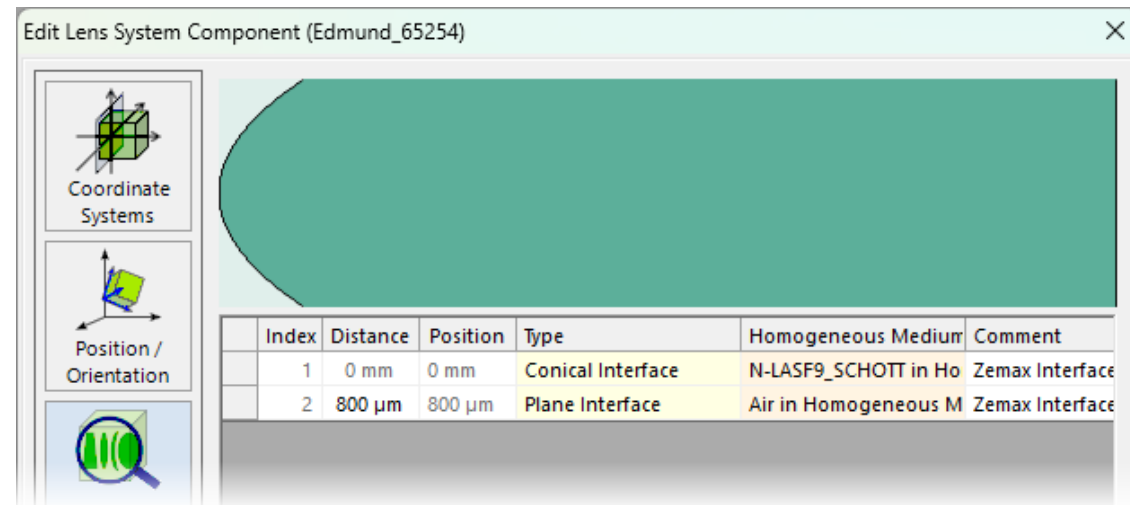

Source selection

System setup

Detector selection

Getting it done in VirtualLab Fusion:

- Zemax import of lens group
- Position and orientation of elements in the optical setup
